
Investors may wonder whether stock returns will suffer if inflation keeps rising. Here’s some good news: Inflation isn’t necessarily bad news for stocks.

• A look at equity performance in the past three decades does not show any reliable connection between periods of high (or low) inflation and US stock returns.

• Since 1992, one-year returns on stocks have fluctuated widely. Yet the weakest returns can occur when inflation is low, and 23 of the past 30 years saw positive returns even after adjusting for the impact of inflation.

• Over the period charted, the S&P 500 posted an average annualized return of 8.1% after adjusting for inflation. The annualized inflation-adjusted return on US stocks is 7.3% when going all the way back to 1926.

History shows that stocks tend to outpace inflation over time—a valuable reminder for investors concerned that today’s rising prices will make it harder to reach their long-term financial goals.
Past performance is no guarantee of future results. Short-term performance results should be considered in connection with longer-term performance results. Investing risks include loss of principal and fluctuating value. There is no guarantee an investment strategy will be successful. Indices are not available for direct investment. Their performance does not reflect the expenses associated with the management of an actual portfolio.
